Quick recap-

Praziquantel is active against cestodes (tapeworms).

Pyrantel pamoate is active against hookworms and ascarids.

Febantel is active against nematode parasites including whipworms.

Oxantel embonate is active against whipworms.

Difference between Febantel & Fenbendazole. Febantel is a prodrug that converts into Fenbendazole making Fenbendazole the active compound for parasite elimination, while Febantel offers potentially better absorption or spectrum.

Pyrantel pamoate and pyrantel embonate are the same active ingredient, just named differently by different pharmacopoeias (US vs. European), with "embonate" being the European term for "pamoate".
